

# CLL788

## Assignment 1

1. Do data visualization using the data given
  - a) Show scatter, histogram, heatmap, box plots (data\_1).
  - b) Now perform the same for (data\_3).
  - c) Calculate the statistics for both data sets.
  - b) Detect the outliers in data\_3 using standard deviation approach and MAD approach.  
(You can use in-built packages if needed)
2. You are CEO of a clothing company with outlets in many cities. You have decided to open an outlet in a new city. To help with the decision of selecting a city, you decide to look at population vs profit data and apply linear regression to see if any relation exists between population & profit with population being the independent variable.
  - (a) Apply Batch LMS, Stochastic LMS and Least Square closed form solution and compare the results. Plot the graphs of the obtained results and training data. Use the learning rate of 0.1. Analyze the results (Convergence time, accuracy etc.) (Don't use in-built packages.)
  - (b) Manually perform the locally weighted least linear regression using the first four data points given in excel sheet. Query point is 7.576 and bandwidth parameter is 0.5. Perform four iterations by using stochastic LMS.
  - (c) Compare the results of Elastic net, Lasso and Ridge regression. (Use in-built packages)

Note: Data for the question one is provided in the excel file "q1.xlsx". Negative values in the profit column mean a loss.

3. A university conducts 2 exams – Aptitude & Verbal as its entrance test to a 2-year program. Based on the scores of these 2 papers, admission is given to students. University has not mentioned the exact criteria of selection. Based on historical data, you need to predict whether a student will get admission based on his/her scores in the 2 exams. Data is provided in q2train.csv & q2test.csv. Train.csv contains training data. First column contains the score of Aptitude exam, 2nd column contains the score of verbal exam and 3rd column indicates whether that student got admission or not. 0 indicates not selected whereas 1 means selected. q2test.csv contains test data.
  - (a) Apply logistic regression on training data with the first 2 columns as input data and the third column as output. Use any suitable learning rate. Now predict admission results on test data (q2test.csv) and print the result in output1.txt with every line of the text file containing either 0 or 1. Plot the results. (Don't use in-built packages.)

## Submission Instructions

1. Submit a zip file on Moodle named "EntryNumber.zip" with all the code files and a pdf with all the graphs and analysis. Only Matlab & python are allowed.
2. for any doubts in the assignment, contact: Tushar Sharma:
